INTRODUCTION

This manual was written for the assembly, installation and maintenance of your new Sno-Way plow. Most importantly, this manual provides an operating plan for safe use. Refer to the Table of Contents for an outline of this manual.

Please keep this manual with your machine at all times as reference material and so it can be passed on to the next owner if the machine is sold.

We require that you read and understand the contents of this manual COMPLETELY, especially the chapter on SAFETY, before attempting any procedure contained in this manual.

The Society of Automotive Engineers has adopted this SAFETY ALERT SYMBOL to pinpoint characteristics that, if NOT carefully followed, can create a safety hazard. When you see this symbol in this manual or on the machine itself, BE ALERT!, your personal safety and the safety of others, is involved.

- Defined below are the SAFETY ALERT messages and how they will appear in this manual.

WARNING

FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH.

CAUTION

Information, that if not carefully followed, can cause injury or damage to equipment!

NOTE: Additional information concerning the equipment or the procedure that may or may not be contained elsewhere in this manual.

BE AWARE! It is illegal to remove, deface or otherwise alter the safety decals mounted on this equipment.

Record the Power Pack Model Number, Power Pack Serial Number, Controller Serial Numbers, Blade Model Number, Blade Serial Number and the Pump Serial Number in the space provided below as a handy record for quick reference. The Power Pack Serial Number is located on the Lower Light Lift Bar (drivers side), the blade serial number is located on one of the middle ribs of the blade. These plates contain information that your Dealer needs to answer questions or to order replacement parts, if needed, for your unit.

We reserve the right to make changes or improve the design or construction of any part(s) without incurring the obligation to install such parts or make any changes on any unit previously delivered.

Graphics and illustrations may be used which may show equipment and/or options not included in every installation without incurring the obligation to install such parts or make changes on units previously delivered.

Sno-Way Service Parts Manuals are available on-line or at your authorized Sno-Way dealer. Request part number 97102170 & 97101915 for the 26V Series Snow Plow. Factory contact information is available at www.snoway.com.
SAFETY

BEFORE ATTEMPTING ANY PROCEDURE IN THIS BOOK, READ AND UNDERSTAND ALL THE SAFETY INFORMATION CONTAINED IN THIS SECTION. IN ADDITION, ENSURE ALL INDIVIDUALS WORKING WITH YOU ARE ALSO FAMILIAR WITH THESE SAFETY PRECAUTIONS.

For your safety Warning and Information Decals have been placed on this product to remind the operator to take safety precautions. It is important that these decals are in place and are legible before operation begins. New decals can be obtained from Sno-Way or your local dealer.

REMEMBER The careful operator is the best operator. Most accidents are caused by human error. Certain precautions must be observed to prevent the possibility of injury to operator or bystanders and/or damage to equipment.

NEVER operate Plow when under the influence of alcohol, drugs or other medications that could hamper your judgement and reactions. An accident may result in serious injury or death to other persons or yourself.

ALWAYS operate vehicle in a well-ventilated area. The carbon monoxide in exhaust gas is highly toxic and can cause serious injury or death.

NEVER allow hands, hair or clothing to get near any moving parts such as fan blades, belts and pulleys. Never wear neckties or loose clothing when working on the vehicle.

NEVER wear wrist watches, rings or other jewelry when working on the vehicle or individual equipment. These things can catch on moving parts or cause an electrical short circuit that could result in serious personal injury.

ALWAYS wear safety goggles when working on the vehicle to protect your eyes from battery acid, gasoline, and dust or dirt from flying off of moving engine parts.

ALWAYS be aware of and avoid contact with hot surfaces such as engine, radiator, and hoses.

ALWAYS wear safety glasses with side shields when striking metal against metal! In addition, it is recommended that a softer (non-chipable) metal material be used to cushion the blow. Failure to heed could result in serious injury to the eye(s) or other parts of the body.

NEVER allow children or unauthorized person to operate this unit.

NEVER exceed 45 m.p.h. when snow plow is attached to vehicle. Braking distances may be increased and handling characteristics may be impaired at speeds above 45 m.p.h.

ALWAYS lock the vehicle when unattended to prevent unauthorized operation of the plow.

ALWAYS check the job site for terrain hazards, obstructions and people.

NEVER exceed 10 m.p.h. when plowing. Excessive speed may cause serious injury and damage of equipment and property if an unseen obstacle is encountered while plowing.

ALWAYS position blade so it does not block path of headlamps beam. Do not change blade positions while traveling. An incorrect plow position blocking headlamp beam may result in an accident.

ALWAYS check surrounding area for hazardous obstacles before operating this unit.

ALWAYS inspect the unit periodically for defects. Parts that are broken, missing or plainly worn must be replaced immediately. The unit, or any part of it should not be altered without prior written approval of the manufacturer.

ALWAYS insert the cylinder lock when plow is not in use. If the cylinder lock is not installed, the plow blade could inadvertently drop and cause serious injury.

ALWAYS shut off the vehicle engine, place the transmission in Neutral or Park, turn the ignition switch to the "OFF" position and firmly apply the parking brake of the vehicle before attaching or detaching the blade from the vehicle or when making adjustments to the blade.

ALWAYS inspect lift system bolts and pins whenever attaching or detaching the plow, and before traveling. Worn or damaged components could result in the plow dropping to the pavement while driving, causing an accident.

ALWAYS keep hands and feet clear of blade and A-Frame when attaching or detaching plow.

NEVER stand between the vehicle and blade or directly in front of blade when it is being raised, lowered or angled. Clearance between vehicle and blade decreases as blade is operated and serious injury or death can result from blade striking a body or dropping on hands or feet.

NEVER work on the vehicle without having a fully serviced fire extinguisher available. A 5 lb or larger CO2 or dry chemical unit specified for gasoline, chemical or electrical fires, is recommended.

NEVER smoke while working on the vehicle. Gasoline and battery acid vapors are extremely flammable and explosive.

NEVER use your hands to search for hydraulic fluid leaks; escaping fluid under pressure can be invisible and can penetrate the skin and cause a serious injury! If any fluid is injected into the skin, see a doctor at once! Injected fluid MUST BE surgically removed by a doctor familiar with this type of injury or gangrene may result.

REMEMBER it is the owner’s responsibility for communicating information on the safe use and proper maintenance of this machine.
General

Install the subframe on the vehicle using the instructions supplied with the subframe package. The pin height should be 8" - 10" off the ground. (See Figure 1-1.)

![Figure 1-1](image)

Electrical Installation

1. Remove the battery power harness and power harness parts bag from the power pack carton.

NOTE: Take extra time needed to plan the routing of wiring harnesses. Make sure harnesses do not interfere with, or contact, any moving parts and route wires away from excessive heat areas. Read all the instructions carefully to ensure a safe and professional installation.

![Figure 1-2](image)

4. Attach the other end of one 2 ft. long power wire to the positive terminal on the battery.

5. Attach the power harness red wire to the other terminal of the fuse holder.

6. Place the fuse between the two studs and replace the nuts and cover.

7. Route power harness to convenient point on front of vehicle for connection to plow.

8. Attach the power harness black wire to the NEG. (-) terminal of the battery and re-connect the negative battery terminal.

9. Spray all terminal connections with a battery terminal protective coating.

10. Secure harness with plastic tie straps.

11. Install truck control harness if needed, using instructions included with controls.

12. Remove the main light harness from the power pack carton. Route the harness from the headlights to the front of the truck and through the grille or bumper. The ends with the green plugs go to the headlights and the ends with the black plugs go to the front of the truck.

13. Open the adapter harness bag, remove the harness and plug the proper adapters into the green plugs on the main harness. Connect the adapters to the truck wiring following the included instructions.

14. Secure the main harness and adapters. Make sure that the harnesses are not in contact with moving or hot engine parts.

15. Plug the male and female black plugs at the front of the truck together. These must be connected to allow the truck lights to operate.

**WARNING**

Disconnect the vehicle NEG. (-) battery cable while performing steps 2 - 5 to avoid serious bodily injury from electrical shock, fire, or explosion. Do not re-connect battery cable until indicated in step 8.

FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH

2. Mount the fuse holder near the battery using (2) #10 x 1" self-tapping screws.

3. Take the cover off of the fuse holder and remove the nuts on the studs. Place one end of the 2 ft. long power wire on one stud. (See Figure 1-2.)
16. Apply included dielectric grease to all connectors.

**NOTE:** An adapter is recommended for vehicles with a side post battery. (See Figure 1-3.) (Adapters can be purchased from your Sno-Way dealer, Part #96100773.

![Figure 1-3](image)

**WARNING**

Failure to connect the main light harness on the truck when plow is not attached will cause truck lights to not operate, which could cause an accident.

**FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH.**

Mechanical Installation

1. Remove the A-frame/tower assembly from the box.
2. Remove pump cover by pulling center rear of cover off of tab, rotate forward and push off of front two tabs. Attach lift link to light/lift bar, Install receiver using instructions included with the controls package. Fill reservoir on pump with supplied hydraulic fluid until the oil level reaches the fill line. Do not overfill or oil may leak from the breather.

3. Set a-frame/tower assembly lower hitch pins into slots on truck subframe. (See Figure 1-4.)

![Figure 1-4](image)

4. Plug in power and control harness and rotate light/lift bar into position. Lock in place by rotating cam handles. Adjust A-frame/tower assembly level using plow control.

5. Once A-frame is level, turn off controller and disconnect the power. (See “Mounting Snow Plow To Vehicle” on page 10).

6. Position the drivers side (DS) and passenger side (PS) wings in front of the A-frame/tower assembly. (See Figure 1-5.)

![Figure 1-5](image)
7. Coat main wing pivot pin with grease and insert through the tower and wings. Leave top of pin approximately 1" above the tower. (See Figure 1-6.)

8. Take deflector and place on tower with the tab on the wing pivot pin going thru the rectangular hole of the deflector. Align bolt holes in the wing pivot pin, deflector, and tower. Push wing pivot pin down to the deflector and tower. (See Figure 1-7.)

9. Secure the wing pivot pin to the tower assembly with one 3/8" -18 x 1-1/4" cap screw and 3/8"-18 Locknut. (See Figure 1-7.)

10. Attach angle cylinder base to tower with a 5/8" x 2-7/8" clevis pin. Insert cotter pins into clevis pins. Attach angle cylinder rod to blade with a 1/2"-13 x 2-1/2" cap screw and 1/2"-13 locknut. (See Figure 1-8.) Repeat for opposite angle cylinder.

11. Attach a plow marker to each wing as shown and secure using 5/16" x 1" cap screws and locknuts. (See Figure 1-9.)
12. Install 90 deg. elbows into wing cylinder ports. Orientate as shown in Figure 1-10.

13. Loosely connect hydraulic hoses to the wing cylinders. (See Figure 1-10, Figure 1-11, and Figure 1-12).

NOTE: C1 through C6 references are hydraulic ports on the control valve that are marked accordingly. (See Figure 1-11 and Figure 1-12.)

14. Loosely position hydraulic hoses in hose clamps (A - 5/16" X 2" self-tapping screw, B - plate, C - clamp blocks) on each side of the A-frame. (See Figure 1-12.)

15. Adjust each hose length from clamps to hose end fittings to 26-1/2” and tighten both clamp screws. (See Figure 1-13.)

NOTE: If installing screw with an impact wrench, ensure that the wrench in adjusted to its lowest torque setting to avoid fastener damage.

16. Orientate hydraulic hoses as shown in Figure 1-10.

NOTE: Hydraulic hoses must be installed as shown in Figure 1-10 to avoid interference with the jackstand.

17. Tighten all hydraulic hose fittings securely.

18. Install pump cover by tilting pump cover forward, sliding pump cover over front two tabs, rotate cover back, and and pull center rear of cover over rear tab.

19. Remove left and right light support brackets from power pack carton.

20. Position the DS light support bracket in position against the lower light lift bar (LLLB). (See Figure 1-14.)

21. Install (4) 3/8” x 1.25” cap screws with (8) flat washers and (4) locknuts from the provided parts into the light support bracket holes, but do not tighten completely.
22. Repeat steps 20 & 21 to install the passenger side (PS) light support bracket to the LLLB.

23. Secure light bar to supports with (6) 3/8" x 1" screws and (6) lock nuts. Tighten cap screws to 45 lb-ft. (See Figure 1-15.)

24. Align light bar supports to vertical position and tighten (8) LLLB/light support brackets cap screws to 45 lb-ft. (See Figure 1-14.)

25. Position a plow light clamp and rubber isolator on the bottom of each plow light, aligning the corner slots in the clamp with the four holes in the isolator and light housings. (See Figure 1-16.)

26. Loosely install two 1/4" x 1" screws, with lock and flat washers, through the front holes (lens side) of the light clamp and isolator into each plow light housing.

IMPORTANT: If longer screws are installed in the front holes, the reflective lens of the light will be broken.

27. Loosely install two 1/4" x 1-1/4" screws, with lock and flat washers, through the rear holes (back side) of the light clamp and isolator into the light module housing.

28. Slide the plow lights onto the respective ends of the light bar bracket, aligning the hole in the bottom of the bracket with the slot in the plow light clamp. (See Figure 1-17.)

29. Install a 1/4" x 7/8" screw with 1/4" washer through each clamp and light bar and loosely secure with a 1/4"-20 nut. (See Figure 1-18.)

30. Apply dielectric grease to all light harness connectors. Connect the plow light harness with the black male connector to the driver side lamp and the plow light harness with the black female connector to the passenger side lamp.

31. Check operation of all lamp functions (Low beam headlamp, high beam headlamp, marker lights and directional signals).

32. Aim plow lights with plow in the fully raised position. Lock the lamps in the adjusted position by tightening four 1/4" x 1" and 1/4" x 1-1/4" horizontal adjustment screws and one 1/4" x 7/8" vertical adjustment screw and 1/4" nut securely. (See Figure 1-17 and Figure 1-18.)

NOTE: In order to conform to Federal Motor Vehicle Safety Standards a SAE J602 Approved aiming device must be used to aim plow lights.

33. Install an end cap in each end of the light bar. (See Figure 1-18.)
Blade Level Adjustment

The Sno-Way 26V has a Max Adjust™ feature that is set when the plow is first installed and when initially run each plowing season. The adjustment mechanism is designed to make the plow wearstrip scrape evenly on flat surfaces without leaving a trail of snow near the center or the edge of the plow. Change in adjustment may be needed due to wear conditions and when the plow is switched between vehicles. Adjustments can be performed with a few turns of a wrench.

Adjustment Procedure

1. Move vehicle to a level flat surface, such as a large parking lot, or a garage floor.

**IMPORTANT:** If plow leveling procedure is being performed on uneven pavement, the plow will be difficult to level correctly. Also include all ballast weight with the truck while adjusting the plow. Any additional weight added to the truck after the plow is adjusted may require the Max Adjust™ system to be adjusted again.

2. Loosen jam nut on the tilt adjustment cap screw located in the center section of the plow trip mechanism. (See Figure 1-19.)

3. Swing wings to the straight position and lower plow to the ground.

4. Turn Down Pressure ON.

5. Swing wings forward to the scoop position, with blade on ground.

6. If the center wear-strip begins to rise off of the floor, stop moving the wings forward and turn the tilt adjustment cap screw out. This will cause the tower to tilt back and towards the truck.

7. Continue to move the wings forward (scoop position) until they are free to move forward and backwards to the straight position.

8. If the center wear-strip begins to rise off of the floor when the wings are brought back to the V-Position, turn the tilt adjustment cap screw in, causing the tower to tilt forward.

9. Once proper adjustment has been attained, tighten the jam nut on the tilt adjustment cap screw.

**IMPORTANT:** Adjusting in Down-Pressure is different than adjusting in Float. If the plow is leveled while in Down-Pressure (which is what is explained in the manual here) the wings will tend to be "off the ground" in scoop, when the Down-Pressure is turned Off. Be aware of which level you are plowing the most in, Down-Pressure-Level, or Float-Level.

**NOTE:** If you set the Plow-Level when in float, the outer wing edge of the wear strip will wear first when down pressure is turned on.
Mounting Snow Plow To Vehicle

1. Drive truck into plow, aligning light/lift bar frame with subframe lugs. Pins should fit inside slots cut into subframe lugs. (See Figure 1-20.)

![Figure 1-20](image)

NOTE: If pins are too high or low to fit into slots on subframe, adjust the plow height after power is connected in the next step. Plug hand held controller into the plow control harness if controller is wired. To lower the pins, turn on down pressure and press down. To raise the pins, press up.

2. Connect the plow and truck power harness connectors together.

![Figure 1-21](image)

WARNING

The power cable in front of the truck is wired directly to the battery. The power cable is always energized, even if the truck is turned off. Always replace the protective cap after disconnecting the plow power cable. Allowing an unprotected plug to contact metal parts of the truck may cause electrical component damage. Never use a metal object to clean the plug contacts.

FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH

3. Remove controller from truck cab (and plug into plow control harness if control is wired).

4. Rotate light/lift bar into position by turning on down pressure and pressing the lower button. (See Figure 1-21.)

5. Rotate mount handles in to lock pins in place. Put plow into float position by turning down pressure off. (See Figure 1-21 and Figure 1-22).
NOTE: Upper hitch pins are fully engaged when mount handle is tight against pin bracket and you cannot see the upper hitch pin between the pin bracket and mount handle.

If upper hitch pins are not fully engaged:
A. Raise plow an inch off the ground, then lower. Or,
B. Turn Down Pressure ON and then OFF.
Upper hitch pins will snap into place. (See Figure 1-21 and Figure 1-22).

WARNING
Make sure that upper hitch pins are engaged before moving truck. Hitch pins not fully engaged could result in the plow separating from the truck.

FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH

CAUTION
Many new vehicles are equipped with onboard circuit sensors designed to display a dashboard LED when a headlight fails. Generally, these sensors are activated or tripped any time the circuit is being called upon to function while the headlight circuit is incomplete. This means that if a headlight fails while the headlight is in operation, the sensor will trip and the dashboard indicator will light up. It also means that if a headlamp socket is left empty—or a faulty lamp is installed—and the circuit is then activated, the sensor will trip and the dashboard indicator will light up.

These headlight circuit sensors are often engineered with pre-designated failure limits. This means that a sensor may be tripped a limited number of times. After that limit is reached the sensor may need to be reset by the dealer or replaced by the manufacturer.

Sno-Way EIS plow light systems essentially operate through a planned interruption of the headlight circuit. When the truck-side connectors are detached from one another, the vehicle headlamps are disconnected from the truck circuits which otherwise power them. Until those truck-side connectors are attached to the plow-side light connectors, the truck-side circuits are open. This means that if the truck’s onboard sensors are active while the plow lights are being attached to the truck, the truck’s sensors may trip.

6. Unplug wired control from plow.
7. Disengage jack stand pin by pulling on pin handle. Rotate the jack stand to the raised position. Engage the pin by pushing on the handle. Make sure pin is engaged in hole by rotating jack stand back and forth. (See Figure 1-23.)
8. Unplug light harness connectors on truck, and light connectors on plow, which had been plugged together for corrosion protection during storage. (See Figure 1-24.)

9. Plug plow light connectors into mating connectors on truck light harness. (See Figure 1-25.)

10. If control is wired, plug control inside truck cab and control harness on plow into truck.

11. Raise, lower and angle plow to make sure no hoses or wires pinch in the plow mechanism.

**CAUTION**

To avoid unnecessarily tripping the truck’s sensor, every time the plow lights are being attached to the truck circuits or the truck circuits are being reattached to the vehicle lights, the truck’s lights should be turned off.

Due to the aforementioned concerns, operators of vehicles equipped with EIS lights should make themselves aware of whatever circuit sensors may be installed on their vehicles. Operators should further become familiar with their vehicle manufacturer’s description of how their truck’s sensors are actuated or tripped. Finally operators should know whether predesignated failure limits may be engineered into their truck’s sensors and what repair or replacement procedures are recommended should those limits be reached. Currently, the vehicle models affected are as follows:

- 2006 and later-Dodge Dakota and Durango - All packages.
- 2006 and later-Dodge 1500, 2500 and 3500- All packages.
- 2008 Ford F250-F550 - All packages.

---

**WARNING**

Failure to properly connect plow lights to vehicle light harness will prevent plow lights from functioning. Follow proper procedure to connect light harnesses and test lights before operating.

**FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH**

10. If control is wired, plug control inside truck cab and control harness on plow into truck.

11. Raise, lower and angle plow to make sure no hoses or wires pinch in the plow mechanism.
Installing The Cylinder Lock Clamp

WARNING

Always install the cylinder lock clamp when the plow blade is raised and the operator is not engaged in plowing operations. Equipment failure or inadvertent operation of the plow control while driving could allow the plow blade to fall, resulting in injury.

FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH

1. Raise the plow to the full UP position.
2. Turn the ignition OFF and apply the parking brake.
3. Turn OFF the hand-held controller.
4. Remove the pin from the cylinder lock clamp.
5. Position the cylinder lock clamp around the exposed (chrome) portion of the lift cylinder with the open side of the cylinder lock up. Install the pin. (See Figure 1-26.)

Figure 1-26

6. Lower the plow so that cylinder lock clamp is tight against cylinder.

WARNING

Failure to lower plow onto clamp could block headlights resulting in an accident.

FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH

Removing Snow Plow From Vehicle

Choose a location for the plow storage, which will allow the plow to be removed from the vehicle and not be moved after removal. Also, choose a location that will not allow the plow stand to sink into the ground. A dry, protected area is recommended.

1. Lower plow to the ground, put vehicle in park, turn off the engine and set the parking brake.
2. Disconnect the plow light connectors from the truck harness connectors. (See Figure 1-27.)

Figure 1-27

3. To prevent corrosion on the contacts, plug the male and female connectors on the plow light harness together. (See Figure 1-28.)

Figure 1-28

4. To make the truck lights operable, plug the male and female connectors on the truck light harness together. (See Figure 1-28.)
5. Disengage jack stand pin by pulling on the pin handle. (See Figure 1-29.)

6. Rotate the jack stand into the lowered position. Engage the pin handle by pushing on the handle. Make sure pin is engaged in hole by rotating jack stand back and forth. (See Figure 1-29.)

7. Remove controller from truck cab (and plug into plow control harness if control is wired).

8. Turn Down Pressure ON and then OFF.

9. Rotate mount handles out to unlock main pins. (See Figure 1-29.)

10. Raise A-frame by pressing the controller UP button.

11. Disconnect the plow control harness connectors and replace the protective storage caps to prevent corrosion on the contacts. (See Figure 1-30.)

12. Disconnect the plow power harness connectors and replace the protective storage caps to prevent corrosion on the contacts.

**WARNING**

Failure to reconnect the main light harness on the truck when removing plow will cause truck lights to not operate, which could cause an accident. Test lights before operating.

**FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH**

**WARNING**

The power cable in front of the truck is wired directly to the battery. The power cable is always energized, even if the truck is turned off. Always replace the protective cap after disconnecting the plow power cable. Allowing an unprotected plug to contact metal parts of the truck may cause electrical component damage. Never use a metal object to clean the plug contacts.

**FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH**

13. Back truck away from plow.
MAINTENANCE

General

• Before operating, perform a thorough visual inspection of the equipment. Look for fluid leaks, cracked, bent or broken components, loose nuts, bolts or attachments and proper fluid levels.

• A clean hydraulic system is essential to long pump life and proper performance.

• When adding oil to the reservoir, wipe the area around the filler port clean before removing the breather cap. Use clean oil and a clean funnel, (DO NOT use a cloth or rag to strain the oil).

IMPORTANT: Sno-Way supplies type 5606 Sno-Way Hydraulic Oil with the unit from the factory. If additional oil is added it must be compatible with Sno-Way oil. If another type of oil has been used in the system the same type of oil must be used for topping off system. Improper hydraulic fluid can cause operating problems in cold weather.

• Do NOT use synthetic oil.

• Oil must contain an anti-foam additive.

• The operational environment for snow plows is an extremely harsh and corrosive one.

• Ensure all electrical connections are clean and tight.

• To prevent rust from forming, clean and repaint exposed metal surfaces.

• NEVER operate the equipment with the protective covers or guards removed.

Periodic Inspection

After approximately every 20 hours of operation perform the following inspections procedures:

1. Inspect the plow assembly including the sub-frame assembly for any damage or excessive wear. Replace parts as necessary.

2. Inspect all fasteners (Plow & Truck Mount) to ensure they are properly tightened. Re-tighten loose fasteners to the proper torque. Loose fasteners on the Bellcrank, Power Unit to the Pump Platform and Truck Mount must have the nylock nuts replaced and tightened while using Sno-Way thread locker 96115529. (Refer to torque specification chart in this manual).
5. Apply a small amount of light oil to the lift cylinder assembly pivot pins and both attach lock pins. (See Figure 1-33 - View From Bottom.)

Special Fasteners Torques and Requirements

IMPORTANT: Incorrectly securing fasteners may result in incorrect operation, excessive wear, and early failure of plow components. It may also void your warranty.

- ALWAYS check to make sure you are using the correct torque specification for the fastener you are using.
- DO NOT use any lubricants on the threads of any fastener unless specifically called for in the assembly or maintenance story for that component.
- NEVER use liquid locking materials, such as Locktite™ or Threadmaker™, on any fasteners unless specifically called for in an assembly or maintenance story for that component.

Standard Fasteners:
The Torque Specifications Chart on page 34 of this manual should be used as the guide for fastener torque requirements for most standard fasteners used on the plow.

Standard fasteners with special torque requirements will be noted in assembly or service stories pertaining to the specific piece of equipment.

Hydraulic Fittings

Hydraulic fittings with lock nuts should be assembled with at least three full turns of the fitting in the port and then the lock nut should be tightened to 27 lb-ft.

Hydraulic fittings with 37 degree flare end swivels should be torqued to 18-20 lb-ft.

Hydraulic Cylinders

To avoid corrosion during storage, coat the exposed (chrome) portion of the lift and angle cylinders with a light grease.

Electrical Quick Disconnect Plugs

This plow is equipped with the EIS® (Energy Interruption System™). Any time the plow is removed from the vehicle, plug the electrical lighting quick disconnect ends together to prevent corrosion from forming on terminal ends.

Fluid Requirements

IMPORTANT: Sno-Way supplies type 5606 Sno-Way Hydraulic Oil with the unit from the factory. If additional oil is added it must be compatible with Sno-Way oil.

It is recommended that the fluid in the hydraulic system be changed once a season.

Do NOT use synthetic oil.
Oil must contain an anti-foam additive.

CAUTION

- Using the proper oil increases the life expectancy of the most critical part of your plow; the Hydraulic power unit.
- Failure to use the proper oil can cause extensive damage to the power unit, seals and hydraulic rams.
- Improper oil can cause operating problems and poor performance in cold weather.
Changing Oil and Cleaning Filter Screen

NOTE: Oil should be changed at the beginning of every season. We recommend cleaning the filter screen at every oil change, this will help ensure maximum life and maximum performance from the pump assembly.

1. Lower plow assembly to ground, put vehicle in park and turn off engine. Turn hand-held controller off.

2. To prevent inadvertent short circuit or electrical shock, disconnect the power harness and control harness at the vehicle bumper.

3. Remove pump cover by pulling center rear of cover off of tab, rotate forward and push off of front two tabs.. (See Figure 1-34.)

4. Remove the filler/breather cap from the reservoir. (See Figure 1-35.)

5. Using an oil suction gun or similar tool, remove the oil from the oil reservoir. 

   NOTE: Be careful to avoid contacting and damaging the filter screen while removing the oil.

6. Remove the lift cylinder hose(s) from the valve block. Remove the wing cylinder hoses from the fitting in the valve block. Mark hoses before removal to be certain they are reinstalled in the correct location.

7. Place the hoses in a container to catch oil expelled from cylinders. Cycle the lift cylinder by disconnecting hitch pins and pushing and pulling on light bar. Cycle wing cylinders by disconnecting from wing and pushing and pulling on cylinder rod.

WARNING

- Allow the system to cool down before draining oil or handling system components. Serious burns can result from contact with hot oil.

- Never disconnect any hydraulic line or fitting with the unit in the raised position. Always lower the unit and relieve pressure before removing any lines or caps.

   FAILURE TO HEED CAN RESULT IN INJURY OR DEATH.

WARNING

Ensure engine is OFF and set parking brake before working on plow. Vehicle movement, equipment failure or inadvertent operation of the control switches during maintenance could result in serious injury

   FAILURE TO HEED CAN RESULT IN INJURY OR DEATH.

WARNING

Using the proper oil increases the life expectancy of the most critical part of your unit; the Hydraulic power unit.
8. Loosen the clamp securing the oil reservoir to the pump assembly and remove the oil reservoir being careful not to damage the filter screen while removing the oil reservoir. (See Figure 1-36.)

![Figure 1-36](image)

9. Pull the filter screens off the return and suction tubes (hold it by the metal cover, not by the screen) and clean with a suitable solvent. Blow dry with low pressure compressed air from the inside.

10. Carefully reinstall the filter screens.

11. Visually check that the pickup tube and filter face down. (See Figure 1-36.) If not, rotate the pickup tube until the tube and filter face down.

12. Clean the oil reservoir inside and out with a suitable solvent.

13. Inspect the O-ring seal for damage, replace if needed, lubricate with fresh oil and reinstall reservoir carefully to avoid damaging the O-ring.

14. Reconnect hydraulic fittings and hoses in their correct position and torque to 20-25 lb-ft. If unit utilizes O-ring and jam nut type connectors tighten jam nut to 15-20 lb-ft.

**CAUTION**

Do Not use Teflon® tape or pipe compound on hydraulic fittings. These can dislodge and jam valves in the hydraulic system.

15. Fill the hydraulic oil reservoir until the fluid level registers full on oil level mark on oil reservoir.

**NOTE:** Vehicle must be parked on level ground, Plow must be in the lowered position, and Wings must be folded rearward ("V") in order to properly check the oil level. Checking oil level with plow elevated or with wings straight or folded forward will give wrong reading.

16. Refer to plow operation instructions and operate the plow to purge all air from the hydraulic system.

17. Replenish the fluid in the reservoir until the fluid level registers full on oil level mark on oil reservoir.

18. Operate system and check for leaks, repair or tighten as necessary.

19. Install the pump cover.

**Cutting Edge Replacement**

**NOTE:** Cutting edge must be replaced when it is worn to the bottom edge of the frame.

1. Raise plow to full up position.

2. Place a jack stand under both ends of the blade bottom rail.

With the Down Pressure™ Hydraulic System OFF, lower plow until firmly resting on jack stands

**WARNING**

The bottom of the cutting edge can be very sharp. Whenever handling a cutting edge, work with an assistant and wear suitable protective gloves to avoid serious injury.

**FAILURE TO HEED CAN RESULT IN INJURY OR DEATH.**

3. With an assistant, remove hardware and worn wearstrip from plow.

4. Insert one carriage bolt through cutting edge and blade on either end of the plow and loosely install one lock nut.

5. Insert one carriage bolt through the opposite end of the cutting edge and blade on the opposite end of the plow and loosely install one lock nut.

6. Insert the remaining carriage bolts and loosely install lock nuts on each.

7. Beginning on either side, tighten all nuts securely.
Plow Shoe Adjustment

This plow is equipped with the ability to utilize four (4) plow shoes. Two plow shoes are located at the outboard end of each wing, and two plow shoes are located on the inboard section of each wing, close to the center tower.

Adjust the plow shoes as follows:
1. Raise plow to full up position.
2. Support blade with a jack.
3. Turn vehicle ignition switch and plow control OFF and apply emergency brake.
4. Adjust shoe assemblies by removing shoe mounting lynch pin and adding or subtracting washers on the top or bottom of the shoe-mounting bracket. (See Figure 1-37.)

5. After the disk shoe position is properly adjusted place remaining washer on the shoe stem - above the disk shoe mounting bracket and below the retaining lynch pin - to remove all up and down movement of the disk shoe in the bracket. Failure to do so will result in excessive wear of the holes in mounting bracket or bending of the disk shoe stem.

IMPORTANT: Snap lynch pin ring over so that it contacts the pin. If ring does not contact lynch pin, rotate the pin and reverse the direction of the ring. If the ring does not contact the pin it is not locked and could fall out.

Trip Spring Adjustment

Check the plow shoe adjustment as follows:
1. Level the tower and wings. (See "Blade Level Adjustment" on page 9).

2. Check gap on springs with a feeler gauge. The gap between two or more coils should be .015" (A 3x5 postcard is approximately .015" thick). (See Figure 1-38.)

If the gap needs adjustment:

a. Loosen the bottom nut on the spring eye bolt(s).
b. Tighten or loosen the top nut until the correct tension is reached, by measuring with a feeler gauge.
c. Tighten the bottom nut(s) on all spring eye bolts.

WARNING

Keep hands and feet clear of wings and center section when setting blocking and lowering plow. Moving or falling assemblies could result in serious injury.

FAILURE TO HEED CAN RESULT IN INJURY OR DEATH.
Operating Classes

The Sno-Way 26V Series plow is specifically designed for commercial applications on 1/2 ton trucks and SUVs. NOTE: The loaded vehicle, including any ballast weight and optional equipment, must not exceed the Gross Vehicle Weight (GVW) or front or rear Gross Axle Weight (GAW) ratings specified on the Safety Compliance Certification Label located on the driver’s side door opening.

For additional information, refer to your dealer and the Sno-Way Application Guide for proper vehicle applications.

Before The Season Begins

1. Inspect vehicle safety equipment for proper operation; brakes, headlights, plowing lights, windshield wipers, flashers, etc.

2. Inspect the plow, plow frame and all attaching hardware for wear and corrosion. Replace worn or damaged parts and clean and repaint exposed metal parts with a high quality, corrosion resistant enamel.

3. Inspect all fasteners to insure that they are properly tightened. If any fasteners are loose, re-tighten to the proper torque (refer to the Torque Specification Chart in this manual) and carefully inspect the adjacent area for damage or wear as well as carefully inspecting all adjacent fasteners for proper torque.

4. Apply a small amount of light oil to the hitch pins, pivot pins and pivot areas of the plow.

5. Check the wing pivots for free movement of the wings on the pivot pin. Coat the wing pivot pin with a good quality light weight HP Lithium based grease.

6. Check the reservoir oil level (see maintenance instructions) and repair any oil leaks and worn hoses.

7. Inspect electrical connectors. Make sure the contacts are clean, and apply a small amount of dielectric grease.

8. Install plow lights and ensure they are aimed properly (with plow in full UP position).

9. If ballast is required position ballast behind rear wheels for optimum performance.

Transporting Vehicle With Plow Attached

1. Position the blade out of the beam path of the headlights before driving.

WARNING

The 26V Series will partially block the plow lights when fully raised, especially if a deflector is present. Always lower the plow so the lights are able to go past the blade in the raised position for transportation. Blocked plow lights could result in an accident.

FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH

CAUTION

Remove the plow when driving extended distances at temperatures above 40° F. The plow blocks enough airflow to the vehicle’s radiator to cause it to overheat at temperatures above 40° F.

2. DO Not exceed 45 m.p.h. when driving with the snow plow attached. Braking distance is increased and handling is impaired dramatically at speeds above 45 m.p.h.

3. Reduce speed when crossing railroad tracks or when road conditions deteriorate.

4. Never change blade angle or height while driving.

5. Inspect plow and plow attaching hardware for wear or damage before transporting and beginning plow operations.
Plowing Like A Pro

WARNING

Wear your seat belt! Contact with a hidden obstruction can cause serious personal injury from bodily contact within the vehicle cab or whiplash from sudden stops.

FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH.

WARNING

- Never exceed 10 m.p.h. when plowing! Serious personal injury can result, as well as damage to equipment and property, if an unseen obstruction is encountered while plowing.

- Never plow with your head protruding from the vehicle side window. Serious head or neck injuries can result from sudden stops or coming into contact with tree branches, signs or other stationary objects.

FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH.

NOTE: The vehicle air bag is factory set to deploy at a pre-determined level of impact. The air bag will deploy with the plow attached if an obstruction is hit with enough force to reach this level. Always plow within the recommended plowing speeds and know the area you are plowing to avoid any obstructions.

For instructions on using the plow controller to manipulate the plow see the manual included with your plow control package.

1. Become familiar with the area to be plowed and mark potential hazards before the snow falls. Many immovable objects cannot be seen when covered with snow. Developing a plan early can save valuable time and equipment damage. Allow sufficient room to pile snow, out of the traffic area, with enough space for snow when the next storm comes.

2. Plow with the storm. The “Pros” are out early removing only several inches of snow at a time. Allowing snow to accumulate to unmanageable levels can cause difficult removal problems and can be costly in terms of “wear and tear” on equipment. The plow is not a “Ram or Bulldozer”, if used properly, it will give you many years of safe and reliable service.

3. Research municipal ordinances for restrictions on the disposal of snow. Many municipalities do not allow snow to be placed in roads or throughway.

4. Research state department of transportation rules on maximum width restrictions for snow plows. Certain blades may require permits.

Using The Down Pressure™ (DP) Hydraulic System

The Down Pressure™ (DP) system was designed for removing hard packed snow from hard surfaces that have had traffic on them prior to being plowed.

The system should be turned OFF when plowing surfaces such as gravel, dirt, sand, etc., to prevent cutting into the surface being plowed.

Activating the system applies hydraulic pressure to the down side of the hydraulic lift cylinder. This down pressure will force the blade through the hard-packed snow and down to the pavement. If down pressure decreases, (results if a valley or low spot is encountered by the blade), more down pressure is applied to lower side of the lift cylinder and the blade will follow the contour of the valley. When a hill or a high spot is encountered by the blade, the down pressure will be relieved on the down side of the lift cylinder, this will allow the blade to follow the contour of the hill without lifting the front of the vehicle off the ground.

WARNING

Wear your seat belt! Contact with a hidden obstruction can cause serious personal injury from bodily contact within the vehicle cab or whiplash from sudden stops.

FAILURE TO FOLLOW CAN RESULT IN INJURY OR DEATH.
Clearing Driveways

1. Head into driveway with the blade angled to move snow away from buildings. Continue to widen the drive path by rolling snow away from buildings on successive passes.

2. If there is a garage at the end of the driveway, plow to within several vehicle lengths of the garage and push the snow off the driveway.

3. Raise the blade and drive through the snow up to the garage. Drop the blade and "Back Drag" the snow 1-1/2 vehicle lengths back. Repeat as necessary.

4. Back the vehicle to garage door and plow forward toward street, removing the remaining snow.

Clearing Parking Lots

1. Plow a single path, with the plow in a "V" position, through the lot at right angle to the side of the lot where you want to "stack" the snow.

2. With the plow angled to one side, widen the path until the snow piled to the side of the path is large enough for a full "scoop" to be moved to the edge of the lot for stacking.

3. With the blade in "scoop" position, push the snow plowed to the edge of the path to the edge of the lot and "stack" it in a pile.

4. If the snow plowed to the edge of the path is too large to push the entire pile to the edge of the lot, fill the blade, in "scoop" position, and then push the pile over into the cleared path and then to the edge of the lot. Then return, and with the blade in "scoop" position, push the remaining row of plowed snow to the edge of the lot.

5. When "stacking" snow, pushing the plow filled with snow into the existing pile will usually cause the plow to raise somewhat as it goes into the pile allowing the "stack" to be built higher.

CAUTION

Excessive stacking of snow causes undue stress to the snowplow and vehicle. Repeated loading of this nature may result in the failure of plow components designed to protect the snowplow and vehicle from major damage.

6. If the snow in the lot is deep and/or hard packed, plow all the paths through the lot with the blades in the "V" position. This will put less sideload on the vehicle and will make plowing the paths easier.
## Troubleshooting Guide

**Introduction**

Whenever service is necessary, your local dealer knows your plow best and is interested in your complete satisfaction. Return your snow plow to your local dealer for maintenance service or any other assistance you may require. If you are unable to do so, this Trouble Shooting Guide should help you determine the problem. However, before attempting the servicing of your plow, you should possess good mechanical abilities and a total understanding of the mechanism.

### CAUTION

First read all warning instruction, the safety messages, and directions before attempting any adjustments or repairs to your unit!

PLEASE: Before calling parts and service personnel be certain that:

1. You have read this guide carefully and are certain that all of the suggestions pertaining to your problem have been attempted.

---

### Troubleshooting Quick Reference

- **General**
  1. Check vehicle electrical system for proper operation.
  2. Check to see that ProConrol™ controller is “on”.
  3. Check all wiring to be sure that battery terminals are clean and connections to battery, circuit breaker, solenoid, switches and all connectors on plow harness are clean and tight.
  4. Check oil level in hydraulic system reservoir.
  5. Check for external leakage at cylinders, hoses and power unit.
  6. Check the voltage at the coils which operate the solenoid valves to be sure that the voltage at the coils is a minimum of 10.5 volts DC.

</tbody>
</table>
**THEORY OF OPERATION**

**Hydraulic Power Unit**

The hydraulic power unit consists of:

- 12VDC Motor
- Hydraulic pump rated at 1.54 GPM @ 1500 PSI
- 1.35 quart capacity reservoir
- Fine mesh intake filter
- Filter screens on all outlet ports

The fluid supply line for the pump is submerged in the hydraulic fluid reservoir and is equipped with a fine mesh intake filter screen.

The 12VDC motor is protected electrically by a 250 Amp fuse located between the battery and the motor solenoid.

The hydraulic pump is protected by a system relief valve.

This unit is equipped with a Down Pressure function which allows the operator to selectively switch the system to provide additional hydraulic force to the cutting edge of the plow.

**IMPORTANT:** The electric coils, which operate the solenoid valves, require a minimum of 10.5 volts DC for proper operation. Lower voltage will cause erratic operation, or failure to operate.

**Electro-Hydraulic Controls**

All hydraulic functions are controlled by the 12VDC electrical system which actuates coils on the hydraulic valves and the solenoid for the electric motor of the power unit. 12VDC power is fed from the battery post of the motor start solenoid to each coil and the plow control receiver.

Each valve is actuated by completing a circuit to ground through the coil, and through the plow control receiver by means of a wire transmitted signal to the plow control receiver from the hand-held controller in the vehicle.

**NOTE:** This is a ground switching system and has power on the coils as soon as power is connected to the plow. The receiver module energizes the coils by providing a ground path to them.

**Raise Mode of Operation**

Actuating the ‘Raise’ switch on the hand-held controller sends a signal to the plow control receiver on the plow which then actuates the motor solenoid and the coils for the 'C' valve and 'F' valve.

Actuating the start solenoid sends current to the power unit motor to cause the power unit to pump hydraulic fluid. Hydraulic fluid, under pressure, is directed through the ‘C’ valve to the lift cylinder causing it to extend and raise the plow. The ‘F’ valve is also actuated to allow fluid in the rod end of the double acting raise cylinder to return to the reservoir.

When the ‘Raise’ switch on the hand-held controller is released the start solenoid circuit is broken and the motor stops, the circuit to the coil for the 'C' valve and the 'F' valve is broken and these valves got to their normally closed positions.

**Hydraulic Controls**

The hydraulic controls consist of:

- System pressure relief valve.
- Two crossover relief valves.
- Two wing relief valves.
- Four three-way two position hydraulic valves and two pilot operated check valves for wing angling functions.
- Two double acting hydraulic cylinders for wing angling functions.
- One three-way two position, three two-way two position valves and two check valves for raise, lower and down pressure functions.
- One down pressure relief valve.
Lower Mode of Operation - Gravity Down and Float

Actuating the 'Lower' switch on the hand-held controller sends a signal to the plow control receiver on the plow which then actuates the coil for the 'B' valve and the 'F' valve allowing hydraulic fluid to flow from the lift cylinder to the reservoir.

When the pressure reaches the proper level, the switch opens, shutting off the motor and pump. The system is protected by a relief valve which relieves excess pressure if the plow is forced up, such as by a bump or obstacle in the roadway.

Once any obstacle is cleared, the plow can return to a lower position lowering the pressure in the system. If the pressure is lowered sufficiently, the pressure switch will then sense the lowered pressure and cause the pump to pump fluid into the system and return it to the proper pressure.

The down pressure system is overridden any time the plow control is placed in the 'Raise' mode, but will resume when placed back into the 'Lower' position.

Also, note that the 'E' valve is deactivated anytime an angle function is activated, but returns to its previous condition as soon as the angle function is completed.

Wing Angling Mode of Operation - Independent Wing Angling

Each wing can be angled forward or rearward independently by operating the forward or rearward switch for either the right or left wing. Operating the left (DS) extend switch on the controller will energize the motor solenoid and the 'A' coil, which will allow hydraulic oil under pressure to be directed to the base end of the left wing cylinder.

Operating the left (DS) retract switch on the controller will energize the motor solenoid and the 'G' coil, which will allow hydraulic fluid under pressure to be directed to the rod end of the right wing cylinder.

Operating the right (PS) wing extend switch will perform the same function as the left except that the 'D' coil will be energized instead of the 'A' coil.

Operating the right (PS) retract switch will perform the same function as the left retract except that the 'H' coil will be energized instead of the 'G' coil.
Combination Wing Angling

Both wings can be moved together using the control switches on the controller. Operating the forward combination switch on the controller will extend both wings in the 'scoop' position. Operating this combination will energize the motor solenoid and both the 'A' and 'D' coils.

Operating the rearward combination switch on the controller will retract both wings into the 'V' position. Operating this combination will energize the motor solenoid and both the 'G' and 'H' coils.

Each wing angling circuit is protected by a crossover relief valve set to relieve pressure on the wing angling circuit. Each wing also has a relief valve that protects the wing when back-dragging.

Fuse

A 250 Amp fuse is located near the battery in the primary 12V DC positive power circuit and is in place to protect the electrical system against direct shorts. A high current draw condition will cause the fuse to open and interrupt power to the plow. Once the cause of the high current situation is identified and corrected replace the fuse.
NOTE: DS - Driver (Left) Side; PS - Passenger (Right) Side
# POWER UNIT
## SOLENOID FUNCTION, WIRING AND LOCATION

### NOTES:
1. Down and Down Pressure functions are latching. All others momentary.
2. Down and Down Pressure functions are released by a UP function.
3. Valve E must be deactivated for angle, wing, v, and scoop functions.

DO NOT use these values if a different torque value or tightening procedure is given for a specific application.

Fasteners should be replaced with the same or higher grade. If higher grade fasteners are used, these should only be tightened to the strength of the original.

<sup>a</sup> “Lubricated” means coated with a lubricant such as engine oil, or fasteners with phosphate and oil coatings.

<sup>b</sup> “Dry” means plain or zinc plated without any lubrication

* Values with asterisk are in lb-in.
DEALER PRE DELIVERY CHECKLIST

The following inspections MUST be accomplished prior to delivering the snowplow to the customer. Place an X in the box after accomplishing each item on the checklist.

CHECK THAT

☐ Parts have not been damaged in shipment. Repair or replace items that are loose, dented or missing.
☐ All covers, guards and decals are in place and attached securely.
☐ All pivot pins and cotters are installed and secure.
☐ Trip springs are adjusted.
☐ Shoe assemblies are installed and adjusted.
☐ Snow plow headlamps are adjusted properly.
☐ Snow plow headlamps are functional.
☐ High Beam
☐ Low Beam
☐ Park Lamps
☐ Left Turn
☐ Right Turn
☐ Headlamp Beam Aimed Correctly
☐ Cylinder lock clamp is installed.

Start the vehicle engine and place an X in the box after accomplishing each item on the checklist.

CHECK THAT

☐ ALL blade functions work properly.
☐ Cylinders, hoses and fittings DO NOT leak.
☐ Listen for abnormal noises or vibrations; Repair or replace as necessary.
☐ The Power Unit is properly filled.

DELIVERY CHECKLIST

The following checklist is to be accomplished with the customer present, Place an X in the box after accomplishing each item on the checklist.

☐ After giving the Customer his Owner’s Manual, instruct him to read it PRIOR to operating the Snow Plow. If he has any questions or does not understand part(s) of the Manual, ask him to contact the Dealer for answers or explanations BEFORE operating the unit.

☐ Record the Serial Numbers, Date of Purchase, Purchaser’s Name and Address, and the Dealers Name, Address and Phone Number in the space provided on Page 1 of the Owner’s Manual.

☐ Demonstrate the mount and dismount procedures.
☐ Demonstrate power plow controller operation.
☐ Demonstrate emergency transport procedures.
☐ Demonstrate Down Pressure hydraulic system function and operation.

☐ Fill out Warranty Registration Card and mail COPY 1 to the factory to validate Warranty. NO Warranty claims can be honored if the Warranty Card is not on file at the factory.
